

ABSTRACT

5 A system and method adapted to linking a group of client stations such
that the operator of one or more client stations can guide or dictate, at least
partially, what is viewed on the other client stations. A first user of a client station
may guide and restrict the browsing of URL resources of other user client stations.
The first user client station transmits a URL resource identifier to a server station,
10 which then sends the URL resource identifier to authorized users of a group. The
client stations of the group users are then directed to the URL resource submitted
by the first user client station. The system allows a user of the group to annotate
the URL resource or web page, and such annotation is contemporaneously
displayed on each of the group client stations.
